

## Acrobat™ Reader 1.0.1 for IRIX™ 5.3

This product is the Adobe Acrobat™ Reader 1.0.1 ported to IRIX™ 5.3. To view the complete set of release notes, please use the desktop *Toolchest* command menu and pull down the *Help/Release Notes* command.

### Product Limitations

The product limitations listed below are contained in all UNIX implementations of the Acrobat™ Reader 1.0.1. These limitations are known by Adobe and will be corrected in the 2.0 version of this product.

#### Limitation:

- Some PDF files may not print to a PostScript Level 1 Printer

A PDF file may be printed either by selecting the *File/Print* Menu command or by creating a PostScript file using the UNIX *acroread* command and then submitting this file to a PostScript printer.

Some PDF files do not print correctly to a PostScript Level 1 printer. If this occurs, first attempt to locate a PostScript Level 2 printer. If such a printer is not available, then it may be necessary to upgrade your printer with more memory.

It may be possible to work around your printer memory limitation, by using the *Edit/Preferences...* menu command and selecting *Sans only* or *Serif only* and then printing the file.

Also note that the Apple Personal LaserWriter NT printer will not properly handle substitute fonts unless it is upgraded to a NTR printer.

#### Limitation:

- Some PDF files cannot be read

The Acrobat™ Reader 1.0.1 cannot read all PDF files. When reading some PDF files, the Acrobat™ Reader will 'hang' or 'abort with error'.
